

BA0-R systems-modeling prior-art research checkpoint

R1 - before BA0 semantic decision

Baseline: 89e5486e02d07ff5b97082f73a2e22ac1b4319ae

Purpose

Preserve the research state before any BA0 responsibility or BAE decision. Sidecar review registries remain separate from the canonical literature registries.

1 Execution state

Chapters 2-4	CLOSED / FINAL
Documentation layer	CLOSED
WO	CLOSED
BA0-R0 SRC-0034 bridge	CLOSED / published
BA0-R1..R8 seed corpus	REVIEW COMPLETED
BA0-R9 OPM challenge	REVIEW COMPLETED
BA0-R10 ISO 42010:2011 regression	REVIEW COMPLETED
BA0-R semantic closure	OPEN
BA0 responsibility/boundary	PAUSED
BA1 BAE ontology	NOT STARTED

2 Corpus recorded

SRC-0039 through SRC-0048 are preserved as notes, excerpt ledgers and LaTeX/PDF worksheets. SRC-0043 remains the ACCESS-LIMITED 2022 ISO record; SRC-0048 is the separate user-supplied full-text 2011 historical edition. The copyrighted ISO source PDF is not stored.

3 Main conclusions

1. Actor + Asset + Interaction is rejected as a sufficient generic core.
2. Structure/referents, behavior, information/resources, typed relations/connections, interface/flow, state/mode, environment/scope, properties/constraints and multi-view representation are recurring semantic responsibilities.
3. Recurring semantic responsibility does not imply a first-class DDTA metaclass.
4. Actor and Asset are poor generic roots; Interaction is insufficient as a universal relation.
5. Channel, Store, Contract, Boundary, State, Flow and InformationObject remain OPEN as first-class roots and are weakened by counter-models.
6. Generic model-based analysis, views/viewpoints, cross-model traceability/consistency and decision rationale are prior art.
7. No Chapter 3/4 reopen trigger is identified.

4 ISO correction

View construction

ISO 42010:2011 supports both synthetic multi-view integration through correspondences and projective extraction from an underlying repository. Therefore one canonical underlying model is not a universal prior-art requirement. A canonical projective Base Analysis remains a DDTA CANDIDATE that must be justified.

5 BA4 terminology warning

If ISO-aligned terminology is adopted, an architecture View is concern-oriented and whole-system-relative; individual partial presentations are architecture models/projections. BA4 must define ‘view’, ‘model’, ‘projection’ and ‘rendering’ deliberately.

6 Next-decision gate

Stop here after commit

This checkpoint does not close BA0-R and does not authorize BA1. After committing the history package, decide whether to merge the candidate sources into the canonical literature registry and close BA0-R, or whether one final correction is required. Only then resume BA0 responsibility/non-goals.
