

DermaTriage A5 Method Bridge Checkpoint

FR → information/data contract → realization

GI-21 preserved immediately as recurring high-priority evidence

This checkpoint does not promote GI-21 into methodology authority. It prevents an implementation-critical recurring finding from being lost before the next methodology revision.

Status	A5 METHOD-BRIDGE CHECKPOINT - TEMPORARY / NON-AUTHORITATIVE
Repository baseline	7311f10d76bc7cce7f2ecf324e7da4a0fbe12dd4
Methodology authority	DDTA_DOCUMENTATION_BA_AUTHORING_GUIDE_R4
A5 frontier	MR-01 D3 PASS; MR-02 STOP AT MR; MR-03 D3 PASS; MR-04 NEXT
BA	NOT STARTED / BLOCKED
Date	4 settembre 2026

Why checkpoint now

The same implementation bridge problem appeared independently in the no-image symptom FR and in the clinical-review FR. Recurrence across unrelated branches means the finding is no longer a local authoring curiosity; it is candidate methodology/tooling guidance with direct impact on implementability and traceability.

Indice

1	Checkpoint trigger	2
2	Recurring evidence	2
2.1	FR-01 - no-image symptom-based urgency	2
2.2	FR-03 - correlated clinical-review registration	2
3	GI-21 - candidate methodology revision	3
4	Companion A5 findings	3
4.1	GI-22 - FR identity vs rule cardinality	3
4.2	GI-23 - shared vocabulary is not a binding	3
5	A5 state preserved	3
6	Mandatory work-plan consequence	4
7	Promotion gate	4
8	STOP and routing	5

1 Checkpoint trigger

During A5, a practical implementation question exposed a gap between the documentation hierarchy and the future engineering path. A FunctionalRequirement can be semantically correct while still leaving implementation-critical data vocabulary, cardinality, field semantics or interface bindings unresolved.

Core finding

The DDTA requirement hierarchy is not the complete engineering-artifact hierarchy. Do not collapse the path to FR -> code. Preserve a traceable bridge from governed functional meaning to the information contract and then to realization.

```

governed FR semantics
  |
  v
governed / source-observed information contract
  |
  v
interface / data binding
  |
  v
realization
  |
  v
code / test

```

2 Recurring evidence

2.1 FR-01 - no-image symptom-based urgency

The governed behavior is: when no image is available, derive urgency from available symptom information. Source-observed vocabulary includes itching, bleeding, growing, changing, pain, etc. However, the source does not establish a complete schema, required/optional status, minimum evidence set or missing-value semantics.

FR-01 information-contract gap

The fields must not disappear because they are needed by implementation, but they also must not be promoted into five artificial FRs or into a falsely complete DTO contract.

2.2 FR-03 - correlated clinical-review registration

The governed behavior is: record a clinician review, correlate it to the reviewed original outcome, and distinguish confirmation from correction. Yet the source does not establish the full correction payload, which result components are correctable, whether one or multiple reviews are allowed, or supersession/finality semantics.

FR-03 information-contract gap

A future implementation must choose concrete fields and cardinalities, but those choices must be traceable to governed meaning and unresolved source gaps rather than silently becoming project truth.

3 GI-21 - candidate methodology revision

GI-21 status

CANDIDATE GUIDE IMPROVEMENT / HIGH PRIORITY / RECURRING EVIDENCE / CANDIDATE L2-L3 TOOL REQUIREMENT / PRIORITY FOR NEXT METHODOLOGY REVISION.

Candidate rule: a FunctionalRequirement must not absorb every implementation datum as a separate Requirement, but implementation-critical governed or source-observed information must remain traceable between FR semantics and code.

For each implementation-critical datum classify at least:

1. governed normative meaning;
2. source-observed vocabulary;
3. unresolved binding / NOT SPECIFIED;
4. realization/configuration binding.

Premature L1 change

This checkpoint does not introduce DataModel, Field, InputContract or similar L1 classes. The evidence currently demonstrates a documentation/tooling bridge requirement; whether an L1 concept is necessary remains open and must be tested across A5 and A10.

4 Companion A5 findings

4.1 GI-22 - FR identity vs rule cardinality

One coherent FR may contain multiple normative clauses or decision-table rows. Independent test cases do not imply independent FRs. The P-scale mapping under FR-02 is the current concrete evidence.

4.2 GI-23 - shared vocabulary is not a binding

Lexical equality between an FR output and another FR input does not prove producer-consumer identity. Semantic identity, context, required attributes and applicability must be verified. The unresolved symptom-derived urgency to P-scale relationship is the current concrete evidence.

5 A5 state preserved

```

MR-01
  DEC-01 -> FR-01 PASS
  DEC-02 -> FR-02 PASS
  D3 CUMULATIVE PASS

MR-02
  STOP AT MR

MR-03
  DEC-03 -> FR-03 PASS
  D3 CUMULATIVE PASS

MR-04
  NEXT

```

DEC-01 underwent a minimal controlled wording repair during cumulative FR review: the Decision now owns only the choice to continue triage without an image, while symptom-based urgency determination is owned operationally by FR-01. A4 was re-closed without changing Decision identity.

6 Mandatory work-plan consequence

From this checkpoint onward, every A5 FR pass must include an information-contract ledger before STOP:

Ledger class	Question
Governed semantics	Which information concepts/values are normatively required by the FR?
Source-observed vocabulary	Which fields/enumerations are present in authoritative evidence but not proven complete/normative?
Unresolved bindings	Which requiredness/cardinality/type/missing-value/cross-FR/lifecycle details remain NOT SPECIFIED?
Realization bindings	Which API/DTO/schema/code/test names implement the meaning without redefining it?

7 Promotion gate

GI-21 must be explicitly reviewed in the next methodology revision. At minimum ask:

1. Does recurrence continue across MR-04 FRs?
2. Can L2/L3 guidance solve the problem without L1 expansion?
3. What minimum information-contract representation is needed for human authors, editor/tool support and code traceability?
4. Can unresolved bindings be represented without forcing false completeness?
5. How should A10 terminology/binding closure consume the ledger produced during A5?

Possible final dispositions remain: PROMOTE TO GUIDE, EDITOR/TOOL ONLY, METHOD PRESSURE, or REJECT. The finding may not be silently dropped.

8 STOP and routing

Checkpoint disposition

GI-21 is preserved now. The authoritative R4 guide remains unchanged. Continue A5 with MR-04 only after committing this checkpoint. Re-evaluate GI-21 at A5 cumulative closure and A10 terminology/bindings. BA remains blocked.
